Education and Research

October 2021

What is Air Pollution?

“Air pollution is the introduction of harmful substances including particulates and biological molecules into Earth's atmosphere.”

“It may cause diseases, allergies or death in humans; it may also cause harm to other living organisms such as animals and food crops, and may damage the natural or built environment. Human activity and natural processes can both generate air pollution.”

Air Pollution from Saharan Dust, Austin, TX, June 2020

Types of Pollutants

- ▶ Primary (produced directly)
 - ▶ Particles
 - ▶ PM10, PM2.5, ultrafine
 - ▶ Gases
 - ▶ Sulfur oxides (SO_x), nitrogen oxides (NO_x), VOCs, etc
- ▶ Secondary (produced by chemical reactions involving primary pollutants)
 - ▶ Classic example is ozone formed from NO_x and VOCs

Image from EPA website

Sources of Air Pollution

- Mobile: cars, buses, planes, trains, trucks, etc.
- Stationary: power plants, oil refineries, industrial facilities, factories
- Area: agricultural areas, cities
- Natural: dust events, wildfires, volcanoes

What is TRAP?

- Exhaust from motor vehicles
 - carbon dioxide (CO₂), carbon monoxide (CO)
 - hydrocarbons (HC)
 - nitrogen oxides (NO_x)
 - particulate matter (PM)
 - mobile-source air toxics (MSATs)- e.g. benzene, formaldehyde, acetaldehyde, 1,3-butadiene
- Non-combustion
 - Resuspended road dust, tire wear, brake wear
 - With increasing emissions controls for exhaust PM, proportion of TRAP PM from noncombustion sources increases
- Secondary pollutants: e.g. ozone
- Contribution to ambient air pollution: “In U.S. cities, the results show that motor-vehicle contributions range from 5% in Pittsburgh, Pa., under conditions with very high secondary aerosol, to 49% in Phoenix, Ariz., and 55% in Los Angeles, Calif.”

Exposure occurs via airways & has systemic effects

Deposition potential for particles of varying sizes

- Nanoparticles enter circulation and can cause direct effects

- Some of these have been found in human brain

(<http://www.pnas.org/content/113/39/10797>)

Biologic markers of exposure or effect

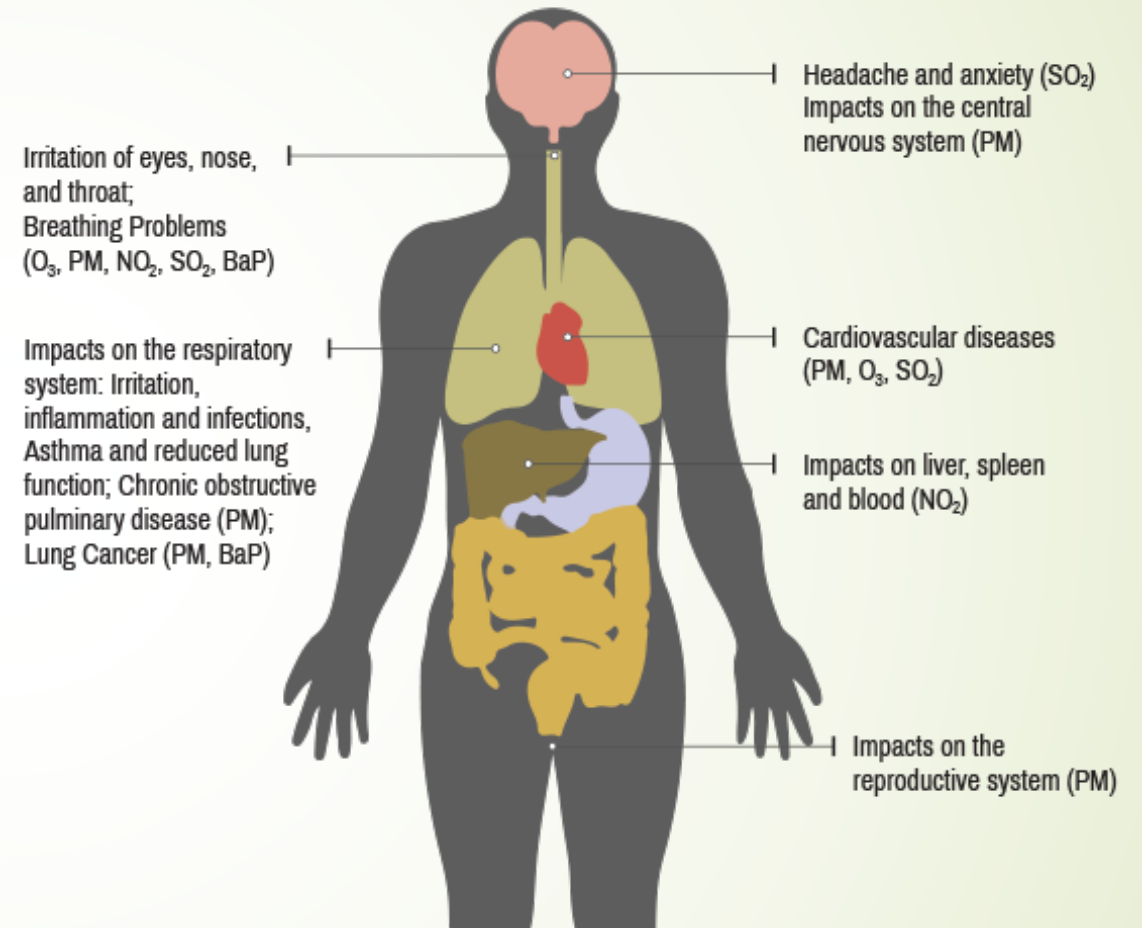

- Marking of DNA - epigenetics
- Visualization of particles in olfactory nerve, brain, placenta
- Elevation of blood, airway, and urinary markers of inflammation

Bove et al, Nature communications. <https://www.nature.com/articles/s41467-019-11654-3>

Maher et al, PNAS <https://www.ncbi.nlm.nih.gov/pubmed/27601646>

What are the health effects of outdoor air pollution?

- ▶ 7 million premature deaths worldwide every year
- ▶ ~88% of those premature deaths in low- and middle-income countries
 - ▶ ~72% of premature deaths due to ischemic heart disease and strokes
 - ▶ ~14% to chronic obstructive pulmonary disease or acute lower respiratory infections
 - ▶ ~14% of deaths due to lung cancer

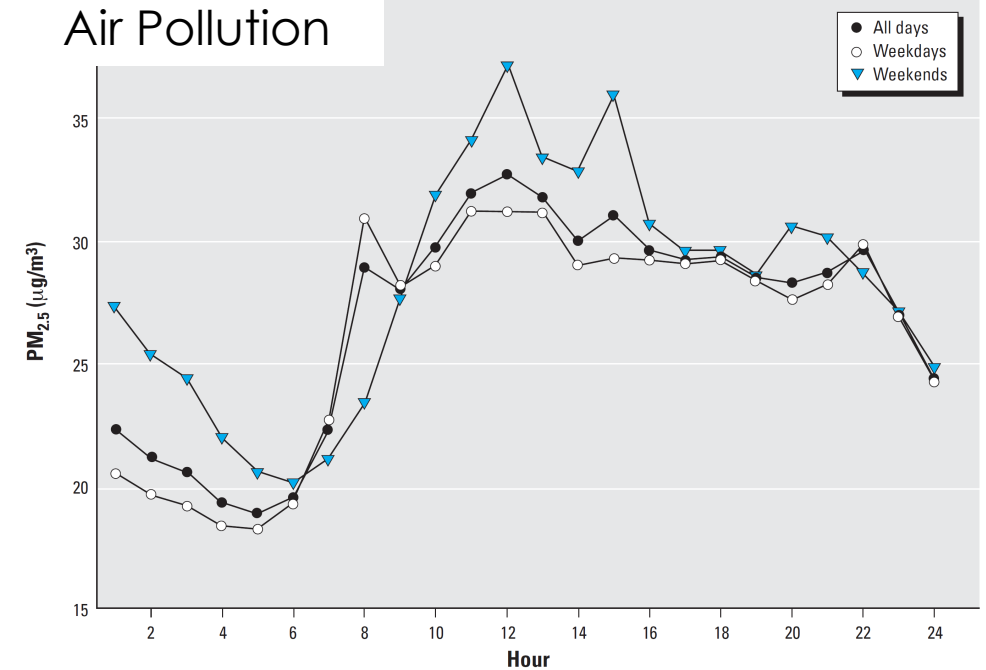

Air pollution acute health effects

- Cardiovascular events (MI, TIA, stroke)
- Respiratory symptoms and events
 - COPD, asthma symptoms, ED visits
- Upper and lower respiratory tract infections

<https://www.healtheffects.org/publication/traffic-related-air-pollution-critical-review-literature-emissions-exposure-and-health>

Higher PM_{2.5} Associated with Decreasing Lung Function

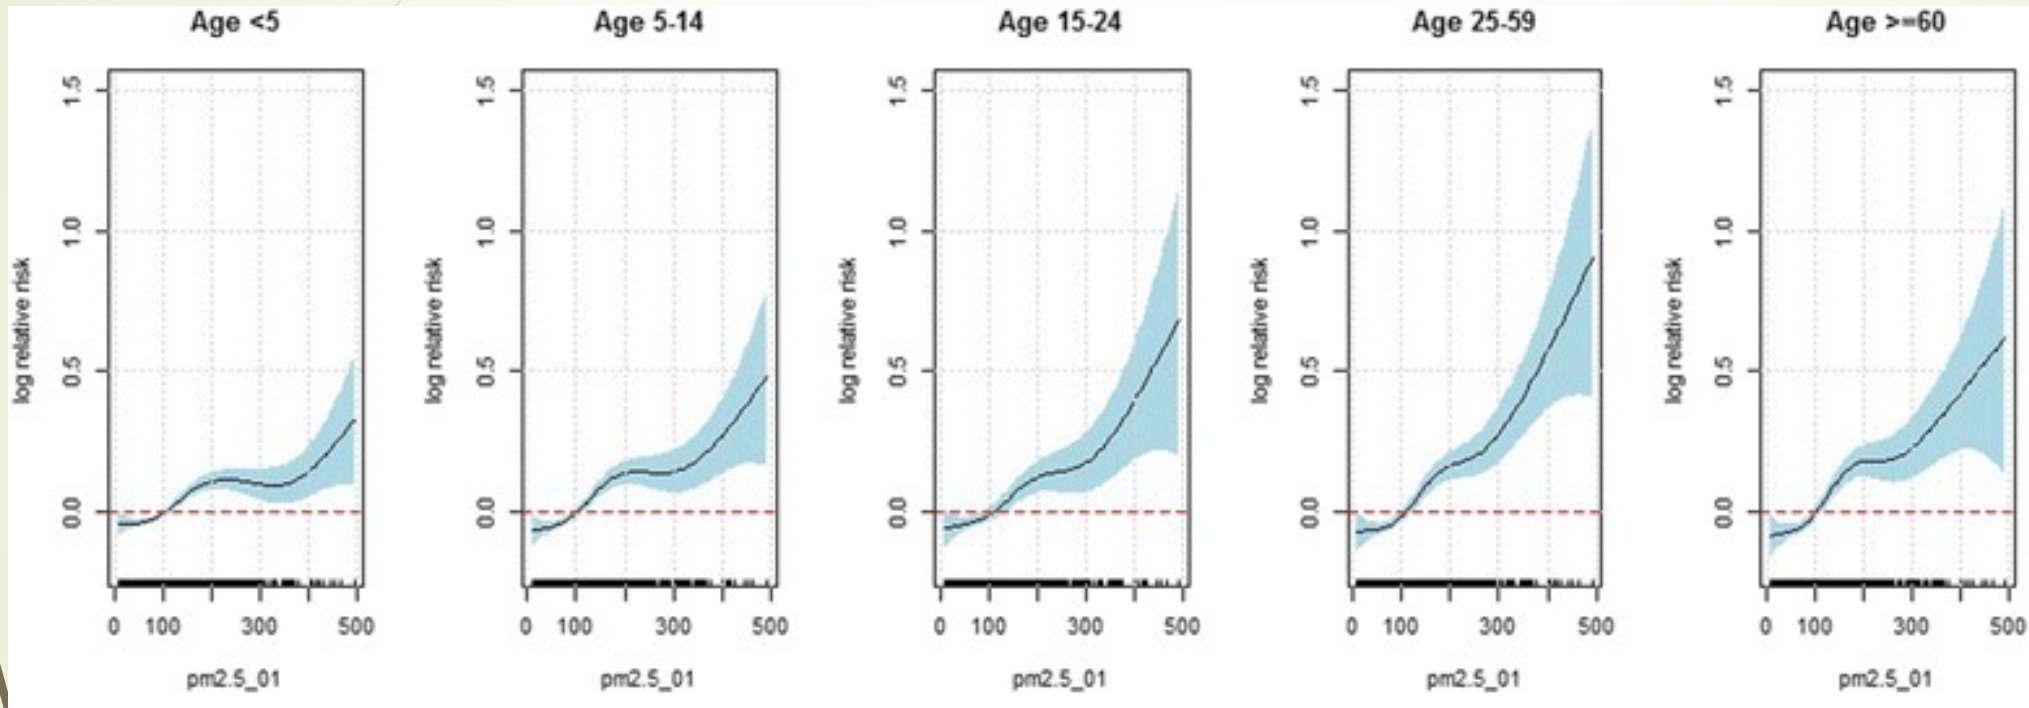

- ~50 children in Los Angeles area
- Exposure: PM_{2.5} (hour maximal concentration)
 - Range from ~19-37mcg/m³
- Outcome: Lung function, FEV₁=forced expiratory volume in 1 second
- Higher hourly personal PM_{2.5} associated with decreasing lung function (FEV₁ % predicted)
 - Effect observed ~8-20 hours after exposure

Lung Function

PM and influenza-like illness in Beijing

- ▶ Time-series study, Beijing
- ▶ Strong, positive association between PM2.5 and influenza-like illness during influenza season (Oct-Apr)

Higher PM_{2.5} Causes Increases in Risk of ED Visits for Asthma

The impact of PM_{2.5} on asthma emergency department visits: a systematic review and meta-analysis 16 studies from developed countries

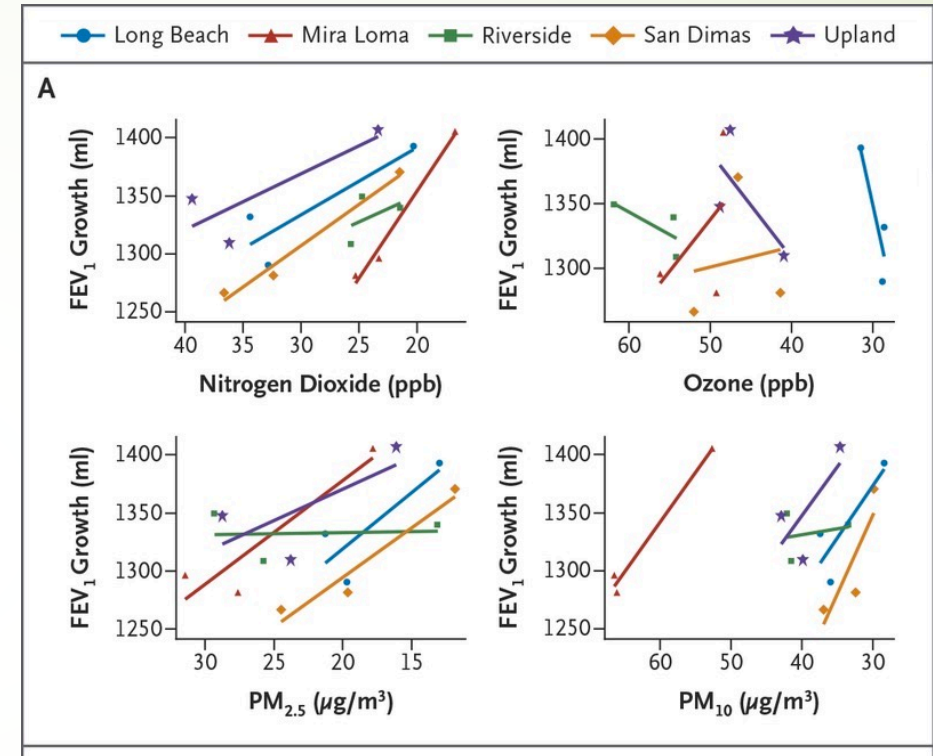

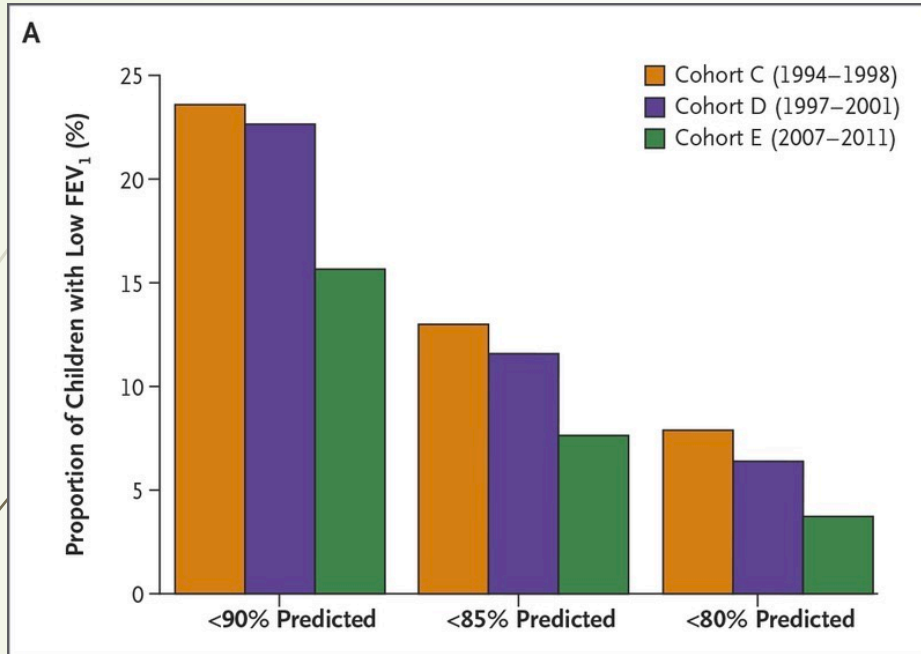

- ▶ RR of asthma ED visit among children for every 10 mcg/m³ increase in PM_{2.5}: 1.036 (1.018-1.053)

Acute Effects of Air Pollution

- ▶ Respiratory symptoms, infections, lung function, asthma and COPD exacerbations
- ▶ Cardiovascular effects – MI, TIA, stroke
- ▶ Deaths
- ▶ Some people are more susceptible than others
 - ▶ Asthma, COPD, lung disease
 - ▶ Cardiovascular disease
 - ▶ Weight
 - ▶ Stress
 - ▶ Co-exposure to cigarette smoke
 - ▶ Genetics

Air pollution chronic health effects

- Effects on outcomes that are a result of exposure over a period of months or years
- Asthma
- Lung function growth
- Birth weight, preterm birth

Air pollution & lung growth

Air Pollution and COVID-19 Mortality Risk

The [Harvard Chan study](#) led by Xiao Wu and Rachel Nethery and senior author Francesca Dominici found an association between air pollution over many years with an 11% increase in mortality from COVID-19 infection for every 1 microgram/cubic meter increase in air pollution (for comparison, many Americans breathe air with 8 micrograms/cubic meter of particulate matter).

While the study does not show that air pollution directly affects an individual's likelihood of dying from COVID-19 because individual-level COVID data is not yet publicly available, it does show an association between long term exposure to air pollution and higher COVID-19 mortality rates.

Emerging air pollution effects on the brain

- Dementia
- Developmental disorders
 - Autism spectrum disorder
 - ADHD
- Psychosis

Anthropogenic air pollution may prove to be more toxic

Non criteria pollutants, meaning those not regulated by EPA, have important health effects

Recent data points to health effects at lower concentrations than regulation standards

What Are Particulate Matter (PM) Air Quality Standards?

[National Ambient Air Quality Standards \(NAAQS\)](#) for PM pollution specify a maximum amount of PM to be present in outdoor air. There are different standards for PM₁₀ and PM_{2.5} (see [Particulate Matter \(PM\) Basics](#) to learn about particle types). Limiting PM pollution in the air protects human health and the environment.

Criteria Air Pollutants

The Clean Air Act requires EPA to set [National Ambient Air Quality Standards \(NAAQS\)](#) for six common air pollutants (also known as "criteria air pollutants"). These pollutants are found all over the U.S. They can harm your health and the environment, and cause property damage.

Learn how EPA [sets, reviews and revises standards](#) (primary standards and secondary standards), [determines whether areas meet the standards](#), and [works with areas to attain and maintain the standards](#).

US Air Pollution Regulation

<https://www.epa.gov/pm-pollution/setting-and-reviewing-standards-control-particulate-matter-pm-pollution>

Impact of Clean Air Act

EPA: Aggregate emissions of six common pollutants dropped 69% between 1970 and 2014.

| | Year 2020 (in cases) |
|---|-----------------------------|
| Adult Mortality - particles | 230,000 |
| Asthma Exacerbation | 2,400,000 |
| Chronic Bronchitis | 75,000 |
| Emergency Room Visits | 120,000 |
| Heart Disease - Acute Myocardial Infarction | 200,000 |
| Infant Mortality - particles | 280 |

New WHO Global Air Quality Guidelines aim to save millions of lives from air pollution

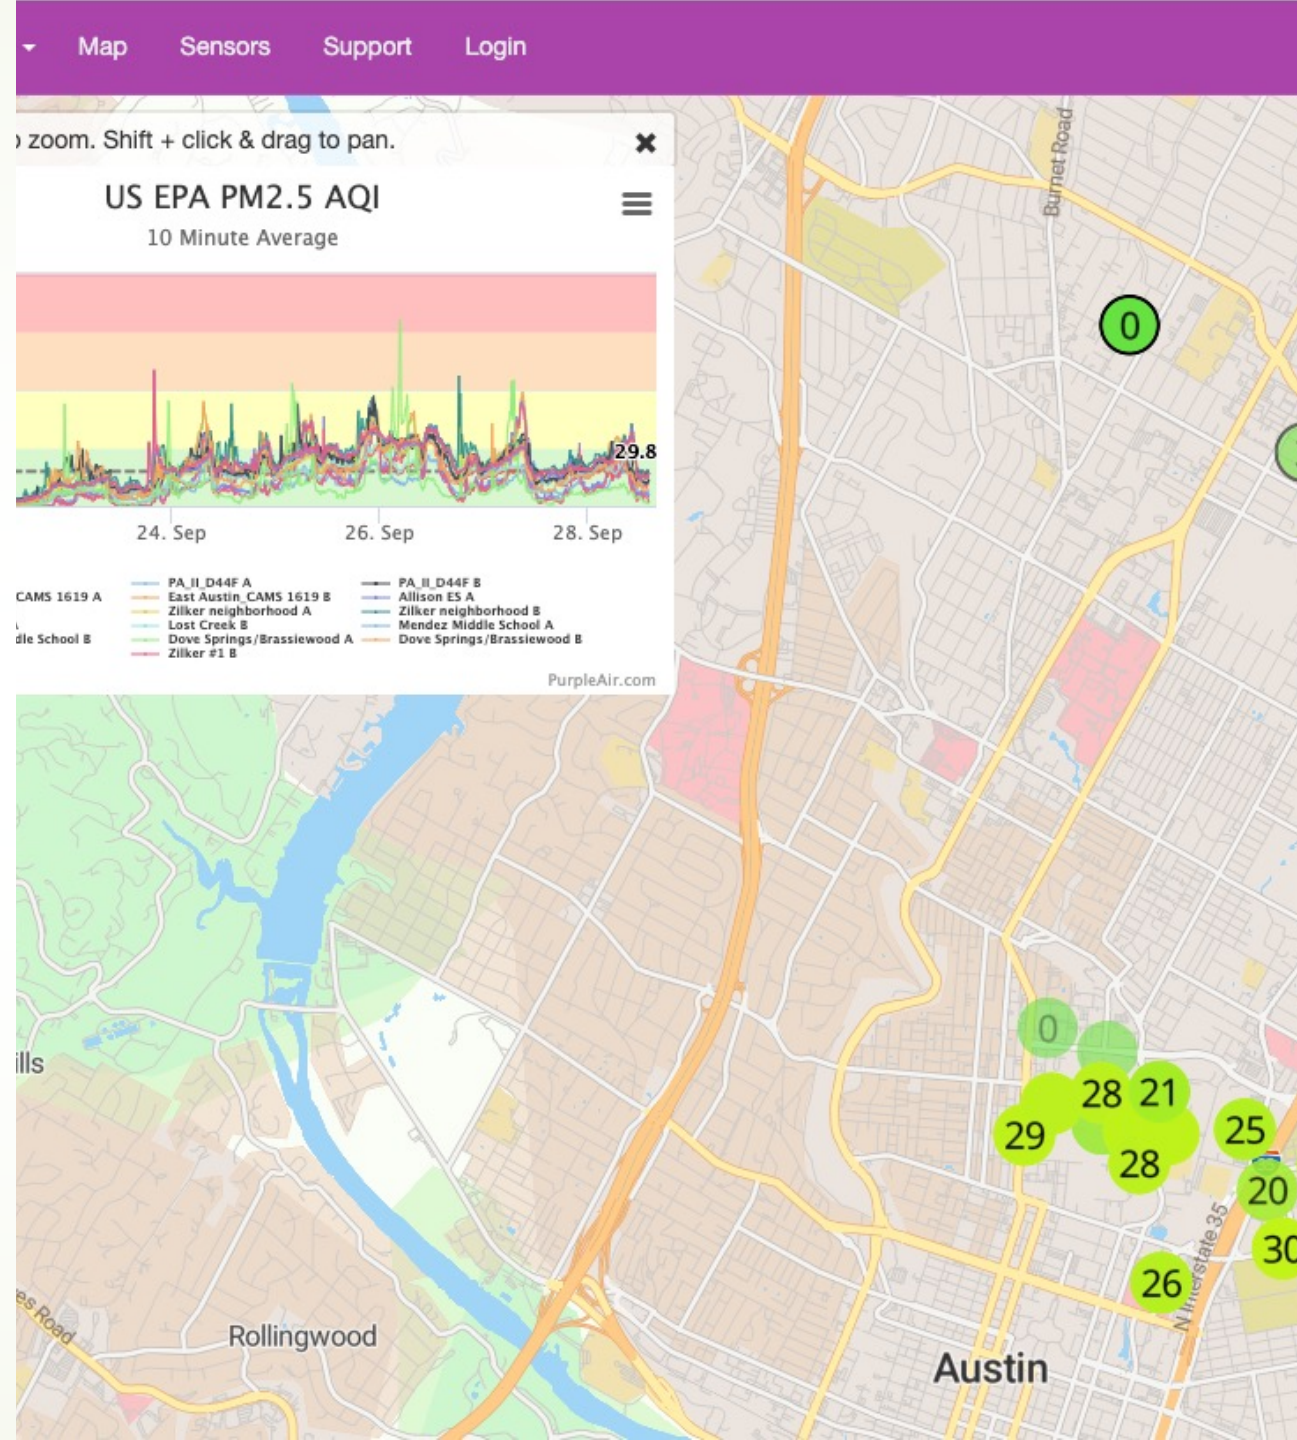

Air pollution is one of the biggest environmental threats to human health, alongside climate change.

22 September 2021 | News release | Copenhagen and Geneva | Reading time: 4 min (1078 words)

Table 0.1. Recommended AQG levels and interim targets

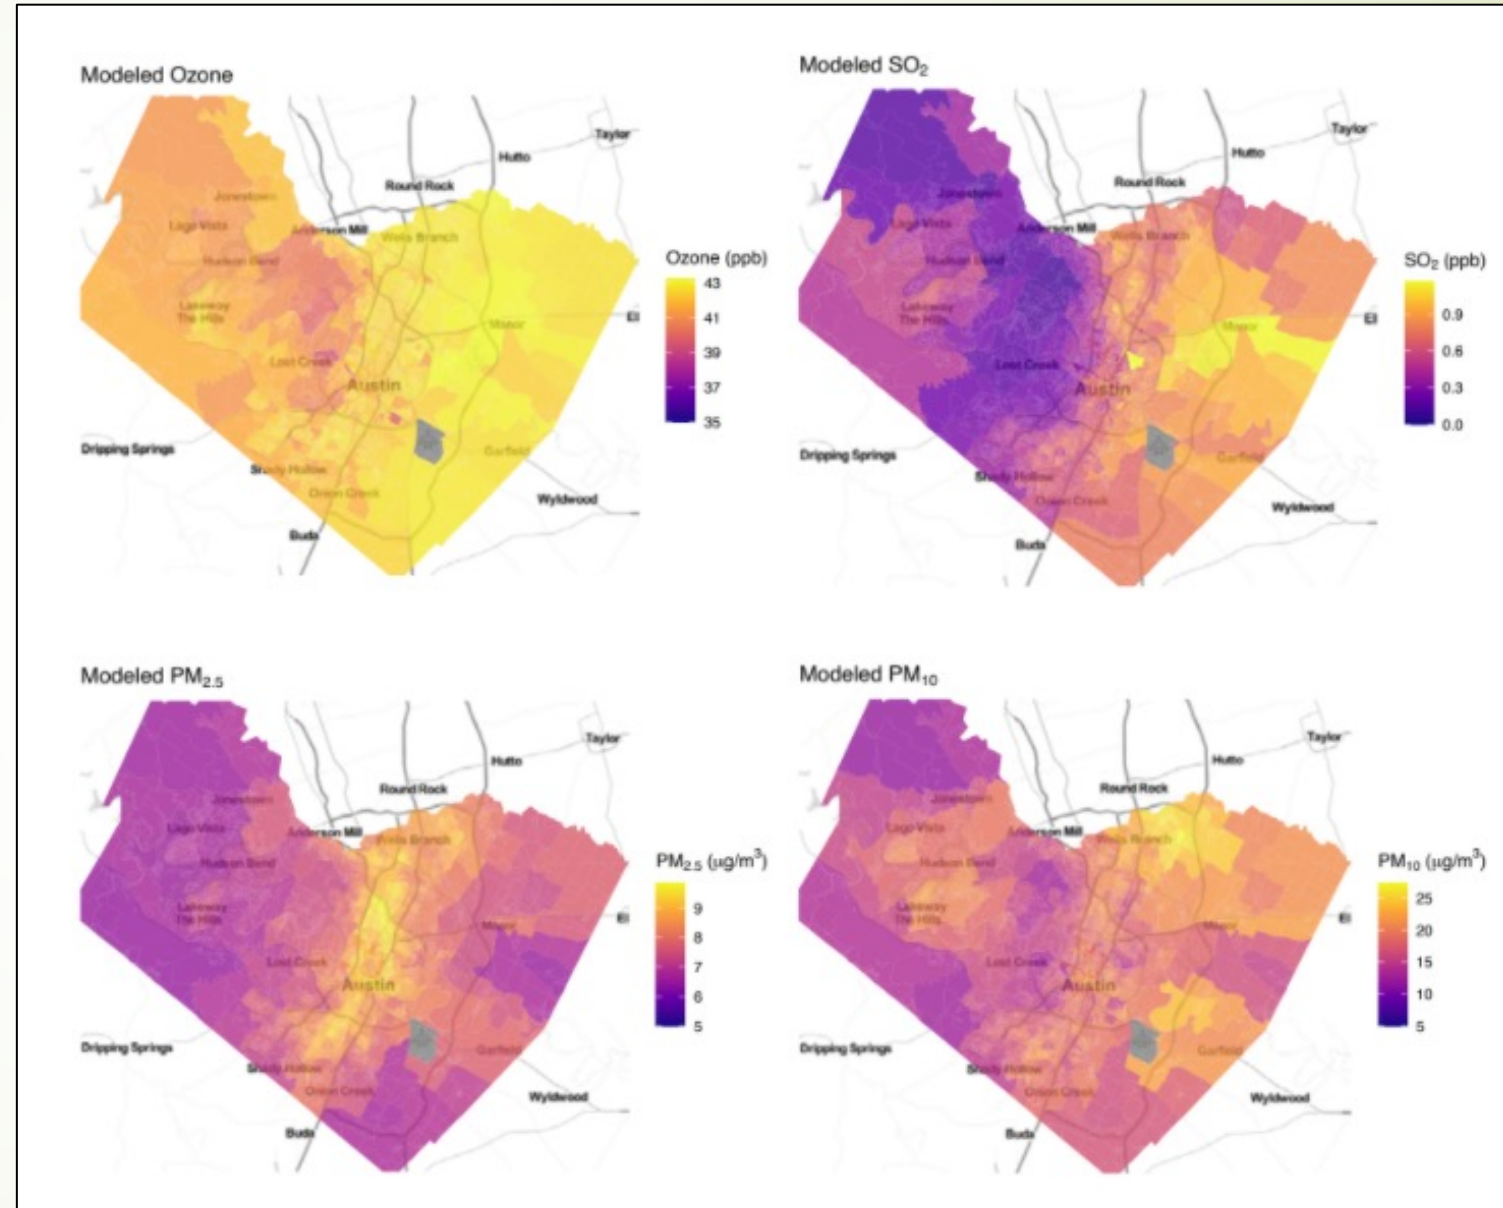

| Pollutant | Averaging time | Interim target | | | | AQG level |
|---------------------------------------|----------------------|----------------|----|------|----|-----------|
| | | 1 | 2 | 3 | 4 | |
| PM _{2.5} , µg/m ³ | Annual | 35 | 25 | 15 | 10 | 5 |
| | 24-hour ^a | 75 | 50 | 37.5 | 25 | 15 |

Consumer-grade air quality monitoring

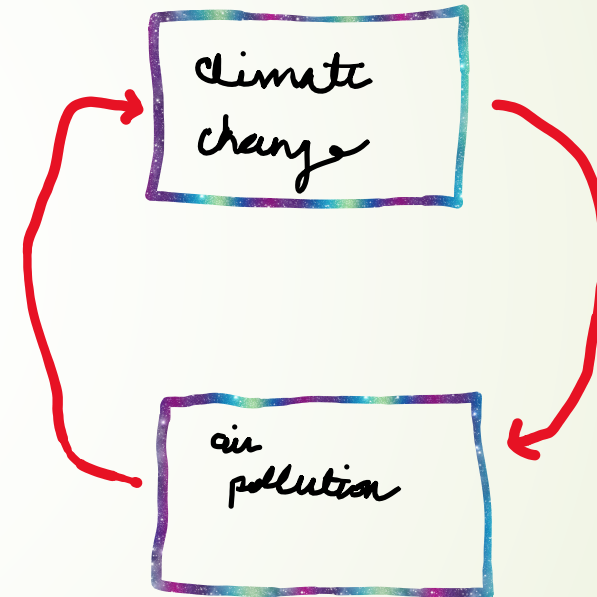

Environmental Injustice in Travis County, TX

(figure credit: Sarah Chambliss, PhD)

Climate Change & Air Pollution Are Inextricably Linked

- Climate disruption → extreme weather patterns (heat waves, droughts, thunderstorms, heavier precipitation, hurricanes, etc.)
 - Consequences → worsening air quality due to high temperatures, forest fires, dust storms, stagnation events
- Pollutants contribute to rising temperatures:
 - Black carbon PM released from fossil fuel, biomass, forest burning → absorbs solar radiation → increases temperature

Climate Change, Forest Fires, & Wildfire Smoke

Environmental Health

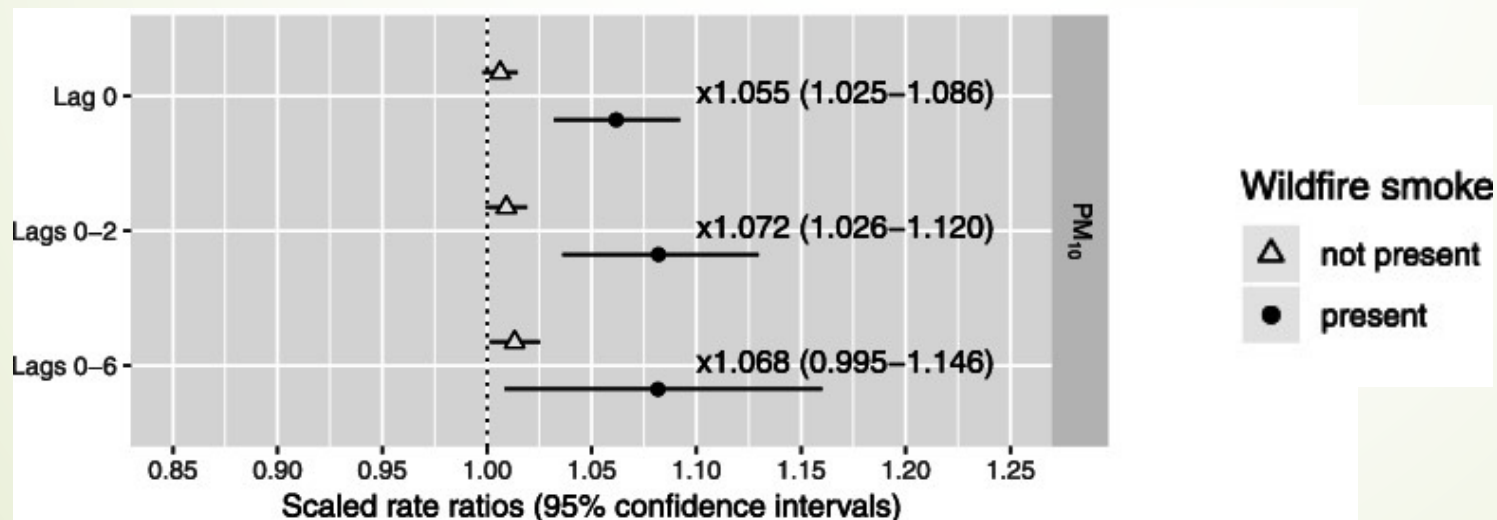

BMC

Particulate matter and emergency visits for asthma: a time-series study of their association in the presence and absence of wildfire smoke in Reno, Nevada, 2013–2018

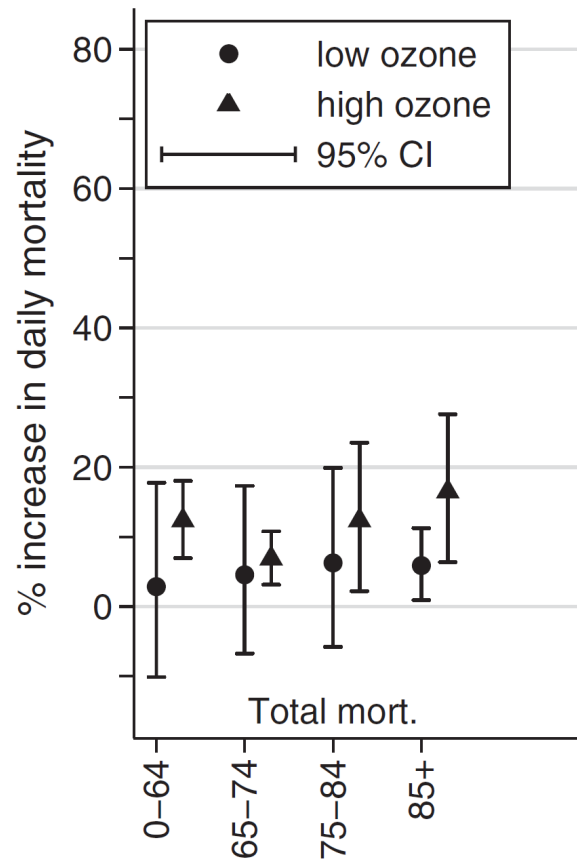

Daniel Kiser, William J. Metcalf, [...], and Joseph Grzymiski

Conclusions

Since we found significantly stronger associations of $PM_{2.5}$ and PM_{10} with asthma visits when wildfire smoke was present, our results suggest that wildfire PM is more hazardous than non-wildfire PM for patients with asthma.

Heat, pollution have synergistic effects on health

Risk of death on heat wave days is higher when ozone concentrations are high

In Landmark Ruling, Air Pollution Recorded as a Cause of Death for British Girl

Legal and environmental experts hailed a coroner's ruling that, for the first time in Britain, directly linked a specific person's death to air pollution.

Take-home messages

- Air pollution kills & has profound effects on health and quality of life
- It disproportionately affects disadvantaged communities – those living in poverty and racial and ethnic minority communities
- Air pollution & climate change are inextricably linked
- There are policy level and individual actions that can be taken

What is the U.S. Air Quality Index (AQI)?

The U.S. AQI is EPA's index for reporting air quality.

How does the AQI work?

Think of the AQI as a yardstick that runs from 0 to 500. The higher the AQI value, the greater the level of air pollution and the greater the health concern. For example, an AQI value of 50 or below represents good air quality, while an AQI value over 300 represents hazardous air quality.

For each pollutant an AQI value of 100 generally corresponds to an ambient air concentration that equals the level of the short-term national ambient air quality standard for protection of public health. AQI values at or below 100 are generally thought of as satisfactory. When AQI values are above 100, air quality is unhealthy: at first for certain sensitive groups of people, then for everyone as AQI values get higher.

The AQI is divided into six categories. Each category corresponds to a different level of health concern. Each category also has a specific color. The color makes it easy for people to quickly determine whether air quality is reaching unhealthy levels in their communities.

AQI Basics for Ozone and Particle Pollution

| Daily AQI Color | Levels of Concern | Values of Index | Description of Air Quality |
|-----------------|--------------------------------|-----------------|---|
| Green | Good | 0 to 50 | Air quality is satisfactory, and air pollution poses little or no risk. |
| Yellow | Moderate | 51 to 100 | Air quality is acceptable. However, there may be a risk for some people, particularly those who are unusually sensitive to air pollution. |
| Orange | Unhealthy for Sensitive Groups | 101 to 150 | Members of sensitive groups may experience health effects. The general public is less likely to be affected. |
| Red | Unhealthy | 151 to 200 | Some members of the general public may experience health effects; members of sensitive groups may experience more serious health effects. |
| Purple | Very Unhealthy | 201 to 300 | Health alert: The risk of health effects is increased for everyone. |
| Maroon | Hazardous | 301 and higher | Health warning of emergency conditions: everyone is more likely to be affected. |
